JewlX Platform - Scheduled Jobs (Cron) Inventory

Status as of 27 October 2026, after the database-load clean-up. Source: the live **cron.job** table of the Supabase project plus the repository code behind each job. All jobs run inside the Supabase Postgres scheduler (pg_cron). Times are given in UTC, Pakistan Standard Time (PKT, UTC+5) and Indian Standard Time (IST, UTC+5:30).

Summary: 11 scheduled jobs remain (6 daily, 1 weekly, 4 monthly). All are light: none touches the diamond inventory pool and none runs longer than a few minutes. Diamond scoring is no longer scheduled at all; it runs only when an admin presses **Run Score Now** (see the on-demand section). Durations are typical values derived from the code and table sizes; exact per-run timings can be read from **cron.job_run_details** at any time.

1. Daily jobs

Job name	UTC	PKT	IST	What it does	Load	Typical duration
daily-leads-report	00:00	05:00	05:30	Sends the previous day's leads summary e-mail (per client, per form) to the admin team.	Light	2-10 s
expire-purchased-credits	00:05	05:05	05:35	Zeroes purchased AI credits that are older than 365 days and writes the wallet transaction.	Light	under 1 s
platform-health-daily-rollup	00:15	05:15	05:45	Aggregates yesterday's health checks into one daily summary row (uptime %, latency) and prunes health data older than 400 days.	Light	under 2 s
nightly-stripe-reconciliation	02:00	07:00	07:30	Compares every Stripe subscription with the client_subscriptions table and corrects any mismatch (cancelled / past-due / new); logs the result.	Light on DB	30 s - 3 min (time is spent on the Stripe API)
cleanup_orphan_ai_previews_daily	03:00	08:00	08:30	Deletes AI preview images in Storage that are older than 60 days and no longer referenced by any design, lead or CAD request.	Medium	1-10 min (depends on number of old files)
platform-health-monitor	06:00	11:00	11:30	Pings every service (database, storage, edge functions, e-mail, CRM, API keys), records latency, captures quota snapshots, opens/closes incidents and e-mails alerts.	Light	10-40 s

2. Weekly and monthly jobs

Job name	When	UTC	PKT	IST	What it does	Load	Typical duration
weekly-jewlx-db-backup	Every Sunday	04:30	09:30	10:00	Backs up the configuration and business tables (clients, forms, Ring OS settings, payments, orders, leads, marketing lists) to Storage as a compressed JSON file; keeps 30 days. Diamond pools, AI preview tables and logs are excluded.	Light	10-60 s
grant-monthly-free-credits	1st of month	00:00	05:00	05:30	Grants each client its monthly free AI credits according to the platform configuration.	Light	under 2 s
trim_old_log_tables_monthly	1st of month	04:00	09:00	09:30	Deletes analytics_events and client_activity_logs rows older than 90 days.	Medium	1-15 min (one large delete)
archive_old_ai_usage_logs_monthly	2nd of month	04:00	09:00	09:30	Rolls AI usage log rows older than 90 days into a monthly summary table, then deletes the detail rows.	Medium	10 s - 3 min
monthly-logs-archive-truncate	1st and 31st of month	21:00	02:00 next day	02:30 next day	Archives and truncates the activity / audit log tables through the archive-and-truncate-logs function and records the run in backup_logs.	Light	10 s - 2 min

3. On-demand processing (not scheduled)

Process	Trigger	What it does	Load while running	Typical duration
Diamond scoring job (diamond-pipeline-job)	Admin presses Run Score Now on the Diamond Pool page after uploading new diamond sheets	Scores every diamond for price outliers, picks the representative stone per shape / carat / colour / clarity group, refreshes the catalogue statistics and filter values, and rebuilds each client's in-stock availability. Runs as 25-40 short steps (rows processed in batches of 100,000) with a 2-minute pause between steps. A temporary cron entry drives the steps and removes itself when the run finishes, so it never appears in the schedule otherwise.	**Medium, in short bursts**	45-90 min wall time; database busy only 1-5 min at a time

4. Jobs removed during the clean-up (for reference)

Former job	Old schedule (UTC)	Why it was removed
diamond-pipeline-tick	every minute	Polled for pending diamond work 1,440 times a day; replaced by the on-demand job above.
diamond-pipeline-nightly	03:05 daily	Forced a full re-score of the whole diamond pool every night even when nothing had changed (10-60 min of full database load).
refresh-diamond-availability / refresh_stale_diamond_availability_5min	every 5 minutes	Rebuilt every client's in-stock list once a day with a full pool scan per client; now rebuilt only when a client confirms their catalogue or after a scoring run.
refresh-diamond-grade-stats, refresh-diamond-group-reps	03:15 / 03:20 daily	Nightly full refreshes of the catalogue statistics; now done as the final steps of the on-demand scoring job.
daily-jewlx-db-backup	20:00 daily	Copied every table including 1.6 million diamond rows every night (1-2 hours of load); replaced by the weekly allow-listed backup.
platform-health-monthly-report	08:00 on the 1st	Monthly summary e-mail not required as a scheduled job; still available on demand from the Platform Health page.

Total scheduled executions per day: 6-7 (was about 1,740 before the clean-up). Combined scheduled database busy time: under 5 minutes on a normal day, up to about 30 minutes on the 1st/2nd of the month when the log trims run.
