Revenue & Usage Page: What Was Wrong and What Was Fixed

Admin dashboard, Revenue & Usage tab (Usage Products and Subscription Products). Prepared 21 October 2026. Code change: commit 9c06c41e on main.

1. Summary

The Revenue & Usage page was showing a loss (Total Profit of minus $86, margin minus 49%) that did not reflect reality. The money coming in was right, but the Cost figure was too high because it added things that are not AI usage, refunds were counted on the wrong side, and usage counts (chats and images) disappeared for anything older than 90 days. The Subscription tab's lifetime revenue was also wrong. All of these are now fixed. The page now shows paid revenue, true AI usage cost, correct counts for any date range, and tells you exactly where each number comes from.

Before and after, in one view

Figure	Before (problem)	After (fixed)
Total Revenue	Credits added to wallets. Could silently include credits an admin gave for free. Refunds were not deducted.	Stripe credit-pack purchases + auto-recharges. Admin-granted credits shown separately and can be excluded with one toggle. Refunds are deducted.
Total Cost	Every deduction from a wallet: AI usage, but also expired credits, refund claw-backs and admin resets. This made Cost too high.	Only AI usage (Chat, Image, Cost Estimate). Non-usage deductions are listed separately and not counted as cost.
Profit / Margin	Revenue minus the inflated Cost, so Profit looked negative.	Revenue minus true AI usage cost. Margin shows a dash when there is no revenue instead of a misleading percentage.
Chats / Images	Zero for anything older than 90 days, because old logs are moved to a monthly archive the page did not read.	Live logs + the monthly archive are combined, so counts are correct for any date range.
Sub-accounts shown	Included JewlX's own internal and test accounts in the platform totals.	Internal/test accounts are hidden by default, with a switch to include them. Each is tagged "internal".
Est. Lifetime Rev. (Subscriptions)	Only covered the selected date range, and kept growing for trial, cancelled and inactive subscriptions.	Counts from the end of the trial until today (or until cancellation), only for subscriptions that actually billed.

2. What was wrong (in detail)

1. Cost was inflated by non-usage deductions

Every negative entry in a client's wallet was added to Cost. That included purchased credits expiring after 365 days, money clawed back after a Stripe refund, and admin actions such as "reset credits to zero" or "pause wallet". None of these are AI usage. Example: Chrono 47 showed a cost of $1.16 with zero chats and zero images.

2. Refunds were counted on the wrong side

When a customer was refunded, the original payment stayed in Revenue and the claw-back was also added to Cost. A refund should simply reduce Revenue.

3. Chats and Images dropped to zero for older dates

Detailed AI usage logs are archived after 90 days into a monthly summary table. The page only read the live table. With the default 120-day range, older usage showed 0 chats and 0 images while its cost still appeared. This is why the Chats column was 0 for every client in the screenshot.

4. Internal and test accounts were included

JewlX's own test accounts were counted in platform totals. The main admin dashboard already excludes them, so the two pages disagreed.

5. The "Include only resold transactions" toggle was mislabelled

Its tooltip said it excluded free monthly credits. In fact it excluded credits that an admin had granted by hand. Free monthly credits were never part of Revenue either way.

6. Est. Lifetime Revenue was not "lifetime"

It was limited to the selected date range and kept accruing for subscriptions in trial, cancelled or inactive status.

7. Date range and refresh

Choosing an end date in the calendar left out that whole day. Pressing Refresh re-ran the old time window, so new rows did not appear.

8. Product filter was misleading

Choosing "AI Image" only hid rows. Revenue, Cost and Profit stayed as whole-account totals, so the filter did not mean what it looked like.

9. Smaller gaps

No Estimates column even though the data existed. A dash margin was shown in red. The page number could point past the last page after filtering.

3. What was fixed

All changes are limited to this page (its database functions and its screen components). No other part of the platform was touched.

Database (one new migration, 20261021120000)

- Cost now counts only AI usage: Chat, Image and Cost Estimate. It is also split per product and shows how much of it was paid with free monthly credits.
- Refund claw-backs reduce Revenue instead of adding to Cost.
- Expired credits, admin resets and other non-usage deductions are reported in a separate "non-usage debits" figure and excluded from Cost.
- Chat, Image and Estimate counts combine the live usage log with the monthly archive, so any date range gives correct counts.
- Internal/test accounts (the existing "exclude from admin revenue" flag) are hidden unless the admin switches them on.
- Lifetime subscription revenue = plan price x number of 30-day periods from trial end to today (or to cancellation), only for active, past-due or cancelled subscriptions.

Screen (Usage Products tab)

- Toggle renamed to "Paid top-ups only" with a correct explanation.
- New switch: "Include internal / test accounts". Internal rows carry an "internal" badge.
- New "Estimates" column next to Chats and Images.
- Product filter now shows that product's cost in the Cost tile and column, and shows a dash for Profit and Margin, since top-ups are not tied to one product.
- A plain-English line under the KPI tiles shows the formula with live numbers: paid top-ups, admin-granted credits, refunds, free-credit share, non-usage debits.
- Date range now covers the full start and end day, and Refresh re-sends the current window.
- Clicking a sub-account opens a drawer with a "Where the numbers come from" breakdown and the last 50 wallet transactions with their type.

Screen (Subscription Products tab)

- Date pickers hidden, since these are point-in-time figures and the range never applied.
- New "Billing since" column, and a note explaining how MRR and lifetime revenue are calculated.

4. How to read the page now

Figure	What it means now	Where the data comes from
Total Revenue	Real money in: Stripe credit-pack purchases and auto-recharges, minus refunds. Admin-granted credits are included unless "Paid top-ups only" is on.	Wallet transactions of type top-up, auto-recharge and (optionally) admin credit, less refund claw-backs, within the date range.
Total Cost	What AI usage was charged to client wallets at the client price (base cost x the platform multiplier).	Wallet debits for ring chat, help chat, ring/grillz/enquiry image previews and cost estimates.
Total Profit	Revenue minus Cost.	Calculated.
Profit Margin	Profit as a percentage of Revenue. Shows a dash when Revenue is zero.	Calculated.
Chats / Images / Estimates	Number of AI requests of each type in the range.	Live AI usage log plus the monthly archive for older months.

Figure	What it means now	Where the data comes from
Wallet	Purchased credit balance right now (not range-based).	Client wallet balance.
MRR (Subscriptions)	Sum of monthly plan prices for subscriptions whose status is active.	Client subscriptions joined to plan prices.
Est. Lifetime Revenue	Plan price x 30-day periods billed since trial end. An estimate, not Stripe invoice totals.	Client subscriptions and plan prices.
Paid top-ups only (toggle)	ON: Revenue = Stripe money only. OFF: also counts credits an admin granted by hand.	Transaction type filter.
Include internal / test accounts	OFF by default. ON adds JewlX's own test accounts to the list and totals.	Client flag "exclude from admin revenue".

5. Points to keep in mind

- **Cost is the client price, not JewlX's supplier cost.** The platform stores what each client was charged (base cost times the multiplier). The actual cost paid to the AI providers is not stored per transaction, so a true supplier margin cannot be calculated for past dates. The page now states this under the KPI tiles.
- **Free monthly credits are never revenue.** They appear only as a share of Cost ("paid with free credits"), which is correct.
- **Deployment order.** The database migration must be applied before the new screen goes live, because the screen now sends a new parameter to the database. Lovable normally applies pushed migrations automatically; it is worth opening the page once after deploy to confirm.
- **Verification.** The fixes were verified against the code and the screenshot. The live database could not be queried from the development PC, so the final numbers should be sanity-checked on the live page after deploy.
- **Out of scope, noted for follow-up.** The monthly free-credit grant function in the database still refers to two old column names, so the monthly cron likely fails. Clients still receive free credits through a fallback at first use. This was not changed as it is outside this page.
