Total Revenue on the JewlX Dashboards

What was wrong, what we fixed, and how revenue is calculated now | 18 September 2026

In short: the revenue numbers on the Admin and Client dashboards were not reliable. Ring OS sales were being saved under the wrong product name, so "RingOS Revenue" always showed $0, and the admin total mixed in tax, shipping, refunds, different currencies and demo accounts. Revenue now comes straight from real paid Shopify orders, using one clear rule, and is split by product and by client.

1. What was happening before

Problem	What it caused
Wrong product label	When a customer bought a ring through Ring OS, the order was saved with the label of the *Ring Builder form*. The dashboards look for the Ring OS label, so RingOS Revenue stayed at $0 and those sales showed up under "Deposits" instead.
Wrong amount	The full Shopify order total was used. That includes tax, shipping and any other store product in the same cart - not just the ring.
Refunds still counted	Refunded and cancelled orders were added into revenue.
Currencies mixed	USD and CAD orders were simply added together and shown as one USD figure.
Demo accounts included	Internal and demo accounts were part of the platform total. One demo account alone held 59 sample orders worth about $830,000.
Missing orders	Deposits paid through the Ring Builder form were never saved at all, because the system did not recognise their label.

2. How revenue is calculated now

Step	Rule
1. Source	A customer pays on the jeweler's Shopify store. Shopify notifies JewlX, and the order is saved under the correct product: Ring OS, Ring Builder, Grillz Builder or Custom Enquiry.
2. Amount	Revenue = **item price x quantity**. No tax, no shipping, no unrelated products. Example: three rings sold at 2,000 + 4,000 + 5,000 = **11,000**. For the forms, the amount is the deposit the customer paid at checkout.
3. Refunds	Orders marked Refunded or Cancelled are left out.
4. Currency	Each amount stays in the store's own currency (USD, CAD ...). Currencies are shown side by side and never added together.
5. Test accounts	Six internal / demo accounts are left out of the **Admin** total: WAVES MVMNT, JewlX, fbe, VDK 7, Lumière Fine Jewelry and Demo Client. Each of them still sees its own numbers on its own dashboard.

3. What you see on the dashboards

Admin dashboard	A **Total Revenue** tile (one figure per currency). Hovering over it opens a breakdown: revenue per product, and under each product a bar chart of which client earned how much, with currency and number of orders.
Client dashboard	**RingOS Revenue** and **Deposits** tiles in the client's own currency. The Deposits tile has a tooltip that splits it into Ring Builder, Grillz Builder and Custom Enquiry.

4. What is not counted as revenue (on purpose)

Quote Estimator form	It has no payment step. It only saves a lead with an *estimated* price, and any deposit is collected later by the jeweler outside the system. It is sales pipeline, not revenue.
Metal IQ	Here the jeweler *buys* metal from the customer, so money goes out, not in. There is no checkout.

5. Where the numbers stand today

With demo data removed, real-client Ring OS revenue to date is **$395** (one order, Henrys Jewelry), plus one Asteri Diamonds order at $0. In the last 30 days the only orders came from an internal test account, so the admin tile correctly shows $0 for that period. The earlier large figures came from demo data, not real sales.

Known limits

- Refunds are not picked up automatically yet. An order leaves revenue when someone sets its status to Refunded or Cancelled on the Orders page.
- For Ring OS clients using deposit mode, revenue is the deposit actually paid, not the full estimated ring price.
- Ring Builder form deposits paid before this fix were never saved and cannot be recovered; all new ones are recorded.

Scope: only the revenue logic on the two dashboards was changed (order labelling, the revenue calculation, and the revenue tiles). No other part of the platform was touched.
